

ABSTRACT

A self erecting pot for containing at least a portion of a floral grouping. The self erecting pot is constructed from at least one non-heat shrinkable sheet of material, at least one heat shrinkable sheet of material, and a plurality of elongated segments of heat shrinkable material. The non-heat shrinkable sheet of material has an inner area, a plurality of panels, and at least one score line. The score line is disposed between the plurality of panels and the inner area of the at least one non-heat shrinkable sheet of material. At least one heat shrinkable sheet of material and the plurality of elongated segments of heat shrinkable material are bonded to the non-heat shrinkable sheet of material, such that, upon heating the heat shrinkable material, the plurality of panels are pulled together and the non-heat shrinkable sheet of material folds along the score line and forms the non-heat shrinkable sheet of material and the heat shrinkable material into the self erecting pot.
